

ESC101 20259 Process Analysis IAT

Constraint Violations (check those violated. No penalty for first constraint violation; -0.5 for second and subsequent violations)	
Shall address two (2) specific observations, each using a distinct CTMF. Shall be between 700 and 1000 words. Shall not exceed three (3) pages of integrated text and graphics. Shall include your name and the word count at the top of the page.	Shall be formatted with 11-point font, 1.1-line spacing, and one-inch margins on standard letter-sized paper. Shall be submitted as a single PDF file through Quercus to the correct assignment. Shall have a file name that follows the Praxis naming convention.

Evaluation Criteria	Unsatisfactory	Satisfactory	Good	Outstanding
Quality of introduction to frame the process analysis	The introduction fails to establish the purpose, or leaves the reader to figure out the purpose and/or how the document is organized OR a clear introduction is missing.	The introduction fulfills the PUBS functions and is relevant to analysis; however, it is vague, generic, mostly restates the assignment, and/or only offers a preview of topics.	The introduction is clear, relevant, and PUBS-complete; it provides the reader with a sense of how the author has framed, interpreted, and/or structured the analysis to follow, and prioritizes previewing key ideas over topics.	<i>As per Good +</i> The introduction is concise and well balanced.
Quality of assessment of how specific observations, as analyzed using selected Praxis CTMFs, contribute to your understanding of the engineering design process thus far	Observations are described factually but text shows no evidence of interpreting the importance of events, steps, or processes; OR analysis is inconsistent, incoherent or overly confusing; OR analysis addresses more than two observations; OR analysis focuses on teamwork rather than the engineering design process. Analysis does not use Praxis CTMFs to support interpreting the observations. Analysis fails to articulate an understanding of relevant aspect(s) of the engineering design process thus far.	The interpretation of the observations is explicit and contextualized; contextualization may be general or partial; an interpretation of the observations with the help of Praxis CTMFs is present but the integration between observation and CTMF and/or the implications of this connection may be generic or vague. Analysis offers an understanding of relevant aspect(s) the engineering design process thus far, but it may be generic or vague.	The interpretation of observations is reflective, informed by well-chosen and clearly discussed CTMFs, and focused on learning to do better engineering design from (a) specific perspective(s); context is used for justification or qualifiers in claims; evaluation of values/abilities/strengths/weaknesses/etc. establishes the significance of actions taken. An understanding of relevant aspect(s) of the engineering design process thus far is offered that shows personal interpretation and ownership linked to concrete experience.	<i>As per Good +</i> Claims are skillfully balanced with evidence and context of the experience; author thoughtfully connects concrete experience with CTMFs through analysis that demonstrates a developing integrated holistic understanding of the engineering design process.
Clarity of future action(s) based on analysis	No future action(s) offered; OR future action(s) is/are disconnected from analysis; OR future actions are too numerous or vague to be effectively explained.	Future action(s) is/are simplistic, and likely to be helpful to future design work and/or next steps in the design process, although it/they may be general in nature.	Future action(s) is/are specific and show(s) insight into how specific actions can impact outcomes; action(s) may involve taking new risk, trying new actions, or reinforcing positive behaviour.	<i>As per Good +</i> Future action(s) enhance the overall analysis and show insightful interpretation of the engineering design process.
Integration of relevant and clear evidence to support the analysis	Evidence is missing, incomplete, irrelevant, or disconnected from the analysis.	Selected evidence is explicitly connected to analysis. Connections may be simplistic. Evidence used may be limited in its usefulness for the analysis (e.g. there may be a mismatch between what is claimed and what the evidence shows).	Selected evidence is appropriately detailed and relevant and is integrated with the analysis such that it is effective in supporting reflection on the engineering design process thus far.	<i>As per Good +</i> The evidence is skilfully presented in a way that supports understanding and enhances the analysis.
Clarity of written and visual expression	Visual elements (figures/tables/boxes/block quotes/etc.) are missing, relegated to an appendix, illegible, or irrelevant to the purpose. Visual elements lack captions and/or explicit mention in the main text. Structure is unclear, ineffective for purpose, and/or is inductively arranged. Language and/or syntax errors and/or lack of proofreading and/or poor formatting choices significantly detract from the readability and professionalism of the report.	Visual elements are present (and captioned), but may not be well used in text. Visual elements may be lacking in areas where they would greatly aid in a reader's understanding. Structure appears deliberate but is generic and may be more inductively arranged than deductively arranged. Writing is readable, but may be repetitive and/or exhibit flourish over concision and/or contain persistent errors that suggest hasty or incomplete proofreading.	Visual elements are integrated into the text and improve understanding and clarity. Structure is effective, deductively arranged, and specific to the analysis. Writing is clear and concise. Word choice is appropriate to the context. Coherence is maintained throughout paragraphs and arguments. Overall document contents and appearance are effective and indicate careful attention to detail in preparing the analysis as a document.	<i>As per Good +</i> Visual elements enhance the text and help guide the reader. Writing style and structure demonstrate understanding of the purpose and context through organizational choices, appropriate use of qualifiers in arguments, clear and concise expression, and precision in word choices.
